Welcome to Aurora 📺

Need help? Tap the chat bubble — Aurora Prime is on call.

THE CONCEPT

A multi-angle performance video inspired by the iconic Colors Show format — bold single-color background, hanging vintage microphone, cinematic lighting — all generated with Aurora and brought to life with your own cell phone performance footage. One phone. One idea. Full video.

WHAT YOU NEED

- ✦ A photo of yourself to use as the subject reference
- ✦ 2 reference screenshots from any Colors-style performance (one wide/full-body, one medium close-up)
- ✦ A cell phone to record your performance
- ✦ Your song/audio ready to perform to
- ✦ An aurora.studio account

STEP-BY-STEP

1

Find Your Reference Images

Screenshot or save two angles from any Colors-style performance — one wide/full-body shot and one medium close-up. These set the composition reference for your Aurora-generated images.

2

Open aurora.studio → Colors Studio → Color Photoshoot

Navigate to **Colors Studio** and choose **Color Photoshoot** — powered by the Aurora Identity model. Set aspect ratio to **9:16**.

3

Upload Reference Images

Upload two images: your Colors reference screenshot + a photo of yourself. Aurora uses both to place you into the scene with your exact likeness.

4

Generate — Wide Angle (Full Body)

Paste the prompt below and hit generate

Welcome to Aurora 🎤

Need help? Tap the chat bubble — Aurora Prime is on call.

Create

Studio

Gallery

Place the subject (man in yellow jacket) into a minimalist studio performance scene. Full-body side profile pose, arms slightly extended forward as if performing. Use the exact suspended vintage studio microphone from the reference – identical shape, size, material, cable – hanging from ceiling at chest level. Keep microphone photorealistic to reference. Environment is a seamless hot pink cyclorama studio – background and floor are one continuous hot pink color, no visible edges or corners. Soft even glossy lighting with smooth gradient. Subject stands on a circular performance platform matching the hot pink tone, slightly elevated with subtle shadow and faint reflective sheen. Preserve exact facial likeness, beard, skin tone, hairstyle, body proportions. Outfit identical: yellow jacket, black shorts, white socks, black shoes, all accessories. Cinematic studio lighting, gentle floor shadow, rim light separation, ultra-realistic skin texture, natural pores, sharp clothing detail, high-end music video aesthetic, 4K photoreal quality.

Pro Tip: Customize by changing "hot pink" to any color you want — red, blue, green, orange. Update the outfit description to match what you're actually wearing. The scene, lighting, and microphone logic stay the same.

5

Generate — Close-Up Angle

Same process, new angle. Upload the close-up reference + your photo, then use this prompt:

CLOSE-UP PROMPT

Place the subject (man in yellow jacket) into a studio performance scene. Medium close-up from chest up. Subject turned slightly to side but mostly facing camera – approximately 30-45° angled pose, majority of face visible (both eyes, nose bridge mostly facing camera, slight cheek contour). Use the exact suspended vintage studio microphone from reference – identical design, metallic finish, hanging cable – positioned in front at mouth level with same spacing as reference. Environment is a seamless continuous super hot pink cyclorama background filling entire frame top to bottom. Preserve exact facial likeness, beard, skin tone, proportions from reference. Outfit identical: yellow jacket, black shorts, white socks, black shoes, all accessories. Cinematic studio lighting, gentle floor shadow, rim light separation, ultra-realistic skin texture, natural pores, sharp clothing detail, high-end music video aesthetic, 4K photoreal quality.

Welcome to Aurora 🎵

Need help? Tap the chat bubble — Aurora Prime is on call.

Create

Pose natural and Studio as if mid-performance, hands

slightly raised or gesturing. Soft even studio lighting, gentle shadows, subtle rim light separation, ultra-realistic skin texture with natural pores, sharp clothing detail, shallow depth of field but subject fully crisp, high-end music video aesthetic, 4K photoreal quality.

6

Record Your Performance

Using your cell phone, record yourself performing your song from the exact two angles matching the images you generated. Match the pose and framing as closely as possible.

📌 **Pro Tip:** You don't need a studio or fancy setup. Make sure your body angle and framing match the generated images — Aurora handles the rest. Perform with energy; the motion transfer picks up on every movement.

7

Animate with Motion

Go to **aurora.studio** → **Motion**. For each angle:

Upload the Aurora-generated image as the source

Upload your cell phone performance video as the motion reference

Add a short prompt to guide the motion (e.g., *"man performing and singing expressively"*)

Hit Generate and let Aurora bring the image to life

8

Edit & Export

Once both angles are generated, combine them in any video editor (CapCut, Premiere, or the Aurora editor). Cut between the wide and close-up angles to match the energy of your performance. Add your song audio — done.

📌 **The Secret:** The magic is in matching your cell phone performance angles to the Aurora-generated images. The closer the match, the better the motion transfer. Take a few attempts if needed — it's worth it.

✂️ CUSTOMIZE IT

This guide uses a hot pink Colors theme

Change the color: Replace "hot pink" with your favorite color

Change the outfit: Update the outfit to match your style

Welcome to Aurora 🎵

Need help? Tap the chat bubble — Aurora Prime is on call.

Create

Studio

Gallery

Change the set: Swap "cyclorama studio" for outdoor scenes, concert stages, etc.

Add props: Add guitar, piano, DJ setup — describe them in the prompt

Welcome to Aurora 🌌

✂ THE CONCEPT

Record a simple performance video anywhere on your phone. Gather 5 reference images. Aurora builds a full AI scene — then you shoot it from multiple angles using re-angle prompts. Aurora Motion animates each angle with your real performance. Edit together for a full music video. One phone recording. Unlimited shots.

✂ WHAT YOU NEED

- ✦ Image 1 — Your Selfie: clear face shot for Aurora to match your exact features and skin tone
- ✦ Image 2 — Your Outfit: flat lay or photo of the clothes you want to wear
- ✦ Image 3 — Your Location: building, street, studio — whatever fits your vibe
- ✦ Image 4 — Pose Reference: a photo showing the pose, camera angle, and staging you want
- ✦ Image 5 — Car or Prop: a car, bike, or prop you want in the background

✂ STEP-BY-STEP

1

Record Your Performance

Film yourself performing your song anywhere — your room, a parking lot, outside. Your phone camera is perfect. This recording is your motion reference for every angle you'll generate.

2

Gather Your 5 Reference Images

Collect: a close-up selfie, the outfit you want to wear, your chosen location, a pose/staging reference, and a car or prop for the background.

3

Open [aurora.studio](#) → Studio → Image

Navigate to the Studio section. Select the Image tab. Choose the **Aurora Identity** model. Upload all 5 reference images.

4

Generate Your Base Scene

Welcome to Aurora ☐

Need help? Tap the chat bubble — Aurora Prime is on call.

Paste the base scene prompt below — swap the highlighted parts for your own details (see the Customize table at the bottom of this section):

BASE SCENE PROMPT — CUSTOMIZE THE HIGHLIGHTED PARTS, KEEP ALL TECHNICAL TERMS

Create a hyper-realistic composite image using the five provided reference images, using the man from the uploaded close-up selfie as the primary identity source, preserving his exact facial features, skin tone, complexion, beard texture, hairstyle, eye detail, and overall likeness with absolute accuracy, replacing the person in the microphone staging reference image with this subject while keeping the same pose, body positioning, framing, perspective, and camera angle exactly as in that reference, dressing the subject in the exact outfit from the outfit reference image consisting of the camo Supreme hoodie, olive green pants, and white Adidas sneakers with accurate colors, fabric textures, proportions, and fit, placing the subject outdoors in front of the Learning Center building from the building reference image as the main background environment, and additionally incorporating the luxury white car from the car reference image positioned behind the subject in the scene in the same relative placement, angle, scale, and visual prominence as the car shown in the microphone staging reference image, ensuring the vehicle looks naturally parked behind the subject as part of the environment, including a vintage hanging microphone suspended directly in front of the subject at mouth level staged identically to the reference image, applying true cinematic shallow depth of field so that the subject, microphone, and foreground remain in razor-sharp focus while both the Learning Center building and the car in the background are softly blurred with natural optical bokeh and realistic lens falloff rather than artificial blur, matching the visual style of imagery shot on an ARRI Alexa cinema camera with a high-quality prime lens, using filmic color science, natural highlight roll-off, accurate dynamic range, professional golden-hour outdoor lighting, and cinematic realism, while implementing advanced skin realism by enhancing all facial imperfections with high-accuracy micro-detail including authentic pores, subtle texture variation, fine lines, micro-creases, natural asymmetry, faint scars, freckles, vellus hairs, and true surface irregularities, strengthening the lighting to create a more natural as matte versus oily zones, and ensuring the shadows are soft and natural without introducing artifacts, correcting any distortions or artifacts, and ensuring the subject's identity and features are fully preserved throughout the entire image.

Welcome to Aurora 🌟

Create

Studio

Gallery

keeping the original color grading exactly as it is, enhancing the eyes with high-fidelity micro-detail including crisp iris texture, natural radial patterns, subtle chromatic variation, accurate subsurface light response, refined eyelids, lashes, and tear ducts with true anatomical detail and natural moisture reflections, maintaining realistic skin translucency, authentic beard stubble detail, and natural lip texture, avoiding any beauty filters or artificial perfection, and producing a final result that is ultra-photorealistic with seamless blending between subject, car, and environment, accurate proportions and perspective, true optical depth, professional cinematic quality, 4K resolution, and absolutely no text, logos, or visual artifacts.

⚠ **Important:** Don't change the technical photography terms (ARRI Alexa, bokeh, skin realism, etc.) — those are what make the output look cinematic. Only swap the parts that describe YOUR specific scene: outfit, location, car, and pose.

5

Generate Different Camera Angles

Upload your base scene result as the reference image, then use these short re-angle prompts one at a time to create 3–5 additional shots from the same scene:

SIDE PROFILE

super close up, from the side front angle of the man, keep bokeh depth of field

WIDE SHOT

wide shot from behind the subject, showing full environment, keep cinematic depth of field

LOW ANGLE

low angle looking up at the subject, dramatic perspective, keep bokeh depth of field

CLOSE-UP FACE

Welcome to Aurora 🌟
Need help? Tap the chat bubble — Aurora Prime is on call.

Create

extreme close-up on the

Studio

Gallery

depth of field

OVER SHOULDER

over the shoulder shot from behind, looking at the scene ahead, cinematic bokeh

DUTCH ANGLE

tilted dutch angle, dynamic composition, dramatic cinematic lighting

📌 **Pro Tip:** Generate 3–5 different angles. You now have a full multi-shot music video — all from one scene and one phone recording.

6

Animate Each Angle with Motion

Go to **aurora.studio** → **Motion**. For each angle:

Upload your Aurora-generated image as the Source Image

Upload your original phone recording as the Control Video

Choose your resolution and hit Generate

7

Repeat for Every Angle

Do this for each angle you generated. Every shot uses the same phone recording — Aurora adapts the motion to each different angle automatically.

8

Edit Together

Cut all your animated angles together in CapCut, Premiere, or any editor. Add your song audio. You now have a full multi-shot music video created from one phone recording and some reference images.

CUSTOMIZE YOUR SCENE

THE CONCEPT

Film yourself performing at any location. Aurora generates a photorealistic image of you holding a phone showing yourself performing — placed naturally into the scene. Then Aurora Motion animates the hand and phone into frame. CapCut motion tracking replaces the green screen with your actual lip sync footage. The result looks like someone filmed you on their phone at an incredible location.

The Secret: The green screen phone trick is key — Aurora puts a green screen on the phone in the generated image, giving you a compositing target for CapCut. Whatever you're wearing in the source video is exactly what appears in the AI output.

WHAT YOU NEED

- Reference 1 — Your Face: a screenshot of yourself from the performance video. This locks in your exact appearance, outfit, and features for Aurora.
- Reference 2 — The Location: the environment you want to be placed in — gas station, rooftop, city street, concert venue, anywhere viral.

STEP-BY-STEP (4 PHASES)

PHASE 1 — RECORD YOUR SOURCE VIDEO

1

Film your performance

Film yourself performing/lip syncing your song at any location. Phone camera works perfectly. Dress for the scene — your outfit carries over to the Aurora output.

2

Screenshot yourself from the video

Take a screenshot of yourself from the video (you can be any person).

Welcome to Aurora ☑

Need help? Tap the chat bubble — Aurora Prime is on call.

3

Get your location image

Create

Studio

Gallery

Find or photograph the environment where you want the scene set. This becomes Reference 2.

PHASE 2 — GENERATE THE AI IMAGE (~11 AURA)

4

Open **aurora.studio** → Studio → Image

Select the **Aurora Identity** model. Set aspect ratio to **1:1**. Upload both reference images.

5

Paste the image prompt and generate

Use the detailed prompt for precise control, or the quick prompt for faster results:

IMAGE PROMPT

Use the first image as the exact base frame. Do not change the environment, pose, lighting, camera angle, car, or the three women in the background. Keep the man's identity, expression, and ultra-realistic skin texture the same. Add a realistic modern smartphone held horizontally directly in front of his mouth with a bright green chroma screen. Include a woman's hand and partial forearm entering from the side holding the phone, wearing a metallic watch and visible arm tattoos. Match scale, perspective, reflections, and contact shadows so the phone and hand blend naturally with the gas station lighting.

QUICK IMAGE PROMPT (SIMPLE VERSION)

put a girl holding a phone in front of his mouth

📌 **Pro Tip:** Two approaches: the detailed prompt gives you precise control over every element. The simple prompt lets Aurora interpret more freely. Try both — sometimes simple works just as well!

PHASE 3 — CREATE THE LIP SYNC VIDEO (~70 AURA)

6

Open **aurora.studio** → Motion

Select the **Aurora Motion** model. Set duration to **10s**, aspect ratio to **9:16** (vertical), Audio: **off**. Upload the image.

7

Paste the video prompt and generate

Create

VIDEO PROMPT

Studio

Gallery

Welcome to Aurora 🌟

Need help? Tap the chat bubble — Aurora Prime is on call.

Start with the first frame as the exact base: man seated in chair at nighttime gas station, arms crossed, eyes closed, car and three women in background unchanged. Maintain identical lighting, camera angle, depth of field, and ultra-realistic skin texture. From the right side of frame, animate a woman's hand with visible tattoos and a metallic watch smoothly moving into the scene while holding a modern smartphone horizontally with a bright green screen. The hand should travel naturally toward his face and stop with the phone positioned directly in front of his mouth, matching perspective, scale, and lighting reflections. Ensure realistic motion easing, subtle wrist rotation, natural finger grip, and correct contact shadows on his beard and hoodie. No change to his body pose or expression; only the hand and phone animate into place.

⚠ **Important:** The more specific your description, the better the result. Describe your outfit, accessories, pose, and the scene's lighting in detail. Aurora works best when you tell it exactly what to keep and what to add.

PHASE 4 — MOTION TRACKING IN CAPCUT

8

Import your generated video into CapCut

Use motion tracking on the phone screen to lock the lip sync to the phone. This makes it look like someone is actually holding a phone with you performing on screen.

BUILD YOUR OWN VERSION — FILL IN THE BLANKS

YOUR IMAGE PROMPT TEMPLATE

Use the first image as the exact base frame. Do not change the environment, pose, lighting, or camera angle. Keep [YOUR DESCRIPTION]'s identity, expression, and ultra-realistic skin texture the same. Add a realistic modern smartphone held [POSITION – horizontally/vertically] directly in front of [his/her] mouth with a bright green chroma screen. Include [HAND DESCRIPTION] entering from the side holding the phone. Match scale, perspective, reflections, and contact shadows so the phone blends perfectly with the [YOUR SCENE] lighting.

Welcome to Aurora 🎬

Need help? Tap the chat bubble — Aurora Prime is on call.

Create

YOUR VIDEO PROMPT TEMPLATE

Studio

Gallery

Start with the first frame as the exact base: [YOUR PERSON + POSE DESCRIPTION] at [YOUR LOCATION], background unchanged. Maintain identical lighting, camera angle, depth of field, and ultra-realistic skin texture. From the [side] of frame, animate [HAND DESCRIPTION] smoothly moving into the scene while holding a modern smartphone horizontally with a bright green screen. The hand should travel naturally toward [his/her] face and stop with the phone positioned directly in front of [his/her] mouth, matching perspective, scale, and lighting reflections. Ensure realistic motion easing, subtle wrist rotation, natural finger grip, and correct contact shadows. No change to body pose or expression; only the hand and phone animate into place.

CUSTOMIZE YOUR SCENE

CUSTOMIZE	EXAMPLE FROM GUIDE	REPLACE WITH YOURS
Person / pose	man seated in chair, camo Supreme hoodie, arms crossed, eyes closed	Describe yourself — what you're wearing, your pose, your look
Location	nighttime gas station, classic car, three women in background	Your location — studio, rooftop, concert, street, beach, anywhere
Phone holder	woman's hand with tattoos and metallic watch	Anyone's hand — friend, clean hand, gloved hand, etc.
Phone position	horizontally in front of his mouth	In front of face, angled up, from the side — experiment!
Vibe / lighting	gas station lighting, nighttime, cinematic	Golden hour, neon, studio lights, natural daylight, moody

PRO TIPS

Dress for the scene: Whatever you're wearing in the source video is what appears in the Aurora output.

Film at viral locations: The more

Welcome to Aurora 📺
Need help? Tap the chat bubble — Aurora Prime is on call.

striking the result. Gas stations, think visually striking.

Create

Studio

Gallery

CapCut motion tracking: This is the finishing touch that sells the illusion. Lock your lip sync content to the phone screen. Without it, you have a great image — with it, you have a viral video.

Multiple scenes: Record ONE performance, then swap out different location images and generate multiple scenes. One take = unlimited viral content.
